BARLEY STRAW PLANTER

INSTRUCTIONS

To use the Summit® Barley Straw Planter simply fill hole with any premium potting soil, add an aquatic fertilizer and an aquatic marginal plant, then water until planter is soaked.

Place planter in pond, planter will float high in the water for about a week until straw becomes completely saturated. Fertilize as needed throughout the season. Planter will remain active improving water quality for about six months.

After straw has finished decomposing, the plant and remaining root ball can be planted into an appropriate size pot and enjoyed for another season.

HOW SUMMIT® BARLEY STRAW PLANTERS WORK

Summit® Barley Straw Planters work by improving water quality in several ways. The natural decomposition of the straw in the water helps to keep water quality pristine. This is accomplished by a natural reaction between the humic acids in the straw from decomposition, sunlight and oxygen. These elements combine to create a condition which keeps water clean. Barley straw promotes healthy populations of invertebrate life that consume harmful contaminants. These tiny creatures are important to the food chain in the pond. All these processes combine to produce a cleaner, healthier and longer lasting pond environment.
