**Clear Water
CALCIUM
MONTMORILLONITE
CLAY
POND TREATMENT**

APPLY ONCE A WEEK

Gather some of the pond water in a bucket. For every 500 gallons of pond water, thoroughly mix 1 tablespoon of clay in the bucket of water. Pour this mixture into the pond. Initially the pond will be cloudy but should clear within 48 hours. More fish may require a heavier application. **Summit's Clear-Water Calcium Montmorillonite Pond Clay cannot be over applied.**

Ingredients: Calcium/Montmorillonite Clay

Artificial fish ponds typically build up various toxins and organic matter which naturally occur due to the decomposition of fish and organic waste products. The breakdown of these natural pollutants acts to cloud the pond's water. Through applying **Summit's Clear-Water Calcium Montmorillonite Pond Clay** you can naturally remove these harmful by-products.

Summit's Clear-Water Calcium Montmorillonite Pond Clay's ability to remove impurities from water is possible due to its unique ionic charge. Clay particles are negatively charged, and form ionic bonds with positively charged impurities in the water. Through this process, the clay particles bond to impurities, and sink to the pond bottom. These are then easily removed by the filter system, making the water crystal clear.

Our calcium montmorillonite clay is harvested from natural deposits, containing minerals and trace elements normally missing in artificial ponds. The nutrients in these clays, when ingested, help the digestive system of your fish, and naturally improve the colors and skin quality of your koi and other fish.
